Professional Experience

Software Development Intern January 2022 - August 2022
24G, Troy MI
• Delivered four Vue.js expo interfaces as the sole frontend developer for Salesforce, Waymo, and Essilor Luxottica, coordinating with the Experiential Team Lead to take each interface from mockup to production.
• Designed and implemented custom page transitions and UI animations beyond the supplied static mockups for Oakley's Vue.js interface, coordinating with the design team to adapt supporting assets.
• Delivered the frontend for an Oakley expo activation that Essilor Luxottica named its favorite of four event experiences and expressed intent to reuse with better placement to increase visibility and participation.
• Owned Campaign Manager's reporting interface and contributed to its API integration. The internal event-reporting tool remained in active company use after the internship.

Projects

Tally - Demo Video | Repository January 2026 - Present
Technologies Used - TypeScript, React Native, Expo, Node, Express, Socket.IO, PostgreSQL
• Built a cross-platform app for personal and shared counters on iOS, Android, and web, with invite deep links, live member presence, and in-app Premium purchases.
• Kept counters usable offline with an on-device change queue that replays on reconnect, paired with server idempotency keys so a retried request never applies the same change twice.
• Implemented password, Google, and Apple sign-in with email verification and rotating refresh tokens stored in the database, sent as HTTP-only cookies on web and Bearer tokens on native.

Job Search Facilitator - Demo Video | Repository July 2026 - Present
Technologies Used - TypeScript, Vue, Pinia, Node, Express, PostgreSQL, Prisma, Codex
• Built a local job-search app that moves AI-sourced roles through Review, Apply, and Track workspaces, keeping reports, application files, outreach, and follow-ups in one place.
• Built responsive multi-panel workspaces that restore filters, selections, and running agent tasks after navigation or a page reload.
• Built a host-side Node bridge that runs read-only Codex tasks, validates each result against a JSON schema, and streams progress and approval prompts to the client over SSE.

Reaction - Live Site | Demo Video | Repository September 2025 - December 2025
Technologies Used - Vue, Pinia, Sass, GSAP, Node, Express, Sequelize
• Built a reaction-time game with adjustable target size, spawn speed, and shrink time, saving each player's settings, scores, and stats to their account.
• Connected the client to the API with cookie-based sessions, keeping settings, recent scores, and profile stats in sync between the game and profile views.
• Saved a settings snapshot with every result, so players can filter their sortable, paginated history to runs played with the same settings.

Technical Skills

Languages - TypeScript, JavaScript, SQL

Frontend - Vue 3, Pinia, React Native, Expo, Sass

Backend & Data - Node.js, Express, Socket.IO, PostgreSQL, Prisma, Sequelize, Zod

Testing & Delivery - Vitest, Cypress, Playwright, Supertest, Docker, GitHub Actions

Education

Central Michigan University, Mount Pleasant MI Graduation: August 2023
Bachelor of Science in Computer Science, Minor in Mathematics
